                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 20; Page 124; 262pp; English.

C through a linker to a solid phase, forming a complex of (A)-solid phase.

C through a linker to a solid phase, forming a complex of (A)-solid phase.

C through a linker to a solid phase, forming a secondary a secondary structure in a benign buffer after liberation from the solid phase, and further the (A)-solid phase complex complex compress an immunogenic substance and/or an immune mediator coupled on (A). The present sequence and/or an immune mediator coupled on (A). The present invention of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold-peptide for attachment points. Alternatively (A) is used as a scaffold-peptide for the incorporation into an Immunostimulating Complex (Iscom) resulting and (A)-iscom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronectin-, laminin- or vitronectin-like binding activities can be used for the promotion of cell-attachment to place and for promotion of wound healing. Also a derivatised (A) can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                        Recombinant, multi-specific anti-Fc receptor antibody molecules also comprise an anti-target portion, used for the treatment of cancer, autoimmune disease and pathogenic infection

Example 7; Fig 24; 115pp; English.

Synthetic DNA coding for the wild-type universal Th epitope from tetanus toxoid, designated TT830, was fused to the 3'-end of DNA encoding heavy chain sequences from the humanised anti-Fc gamma RI monoclonal antibody H22. The resulting fusion protein was shown to be significantly more efficient in antigen presentation and T cell stimulation that the TT830 epitope alone. A similar fusion construct was prepared coding for a mutant, antagonistic form of the epitope (designated TT833) fused to the anti-Fc gamma RI. The Fab22-TT833S is at least 100 times more effective than TT833S in funitioning T cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              carrier; tumour

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wri; 30-22302750.

Synthetic peptide(s) corresp. to tetanus toxin epitope(s) - as universal carriers for prepn. of immunogenic conjugate(s) use as vaccines.

Claim 1; Page 17; 20pp; English.

Epitopic peptides may be used with synthetic hapten derived a pathogen to generate an immune response to the pathogen.

Peptides are recognised by numerous T-helper cell clones with the context of a wide range of alleles of the human MHC.

The peptides may be used in an antimalarial vaccine inducing

This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal grow factor receptor (EGFR), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody) comprising: (a) an anti-Fc receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infecti by a target cell.

The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms administered with the carbohydrate peptide conjugate, and (2) a diagnosis kit comprising antigen-specific antibodies elicited by immunisation with the carbohydrate peptide conjugate. The peptide conjugate, antibody and diagnosis kit are used to provide pharmaceutical compositions and ciagnosis kit are used to provide pharmaceutical compositions and against viral infections caused by hepatitis virus, HIV or cytomegalo virus. They can be used to enhance immune responses, especially B- and T- cell responses, of humans and animals against bacterial infections. The carbohydrate peptide conjugate stimulates the antibody and T-cell is capable of increasing the survival of tumour bearing humans and animals. The present sequence corresponding to this sequence may be used to sa an epitope in a carbohydrate peptide conjugate. Sequence corresponding to this sequence may be used sequence 15 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Weylsbull-Al.

The immunogens
Complex (Iscom) resulting an (A)-Iscom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronectin-, laminin- or vitronectin-like binding activities can be used for the promotion of cell-attachment to plastic surfaces, in particular to inhibit tumour growth and metastasis, and for promotion of wound healing. Also a derivatised (A) can be used for the selection of specifically-binding aptamers or as a diagnostic agent. Such diagnostic-(A) molecules could be used to detect molecules derived from or indicative of pregnancy or of a disease, such as an infectious, autoimmune or cancerous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tetanus toxin helper T cell epitope, TTI.

Tetanus toxin helper T cell epitope, TTI.

Tetanus toxin helper T cell epitope, TTI.

Tetanus toxin helper T cell epitope; immunogen; helper T cell; epitope; clostridium tetani.

                                                                                                                                                                                                                                                                                                                                 This T-cell antigen TT2 peptide may be attached to a core peptide contained in one of the 2 subunits of an alpha-helical coiled-coil heterodimer. Each core peptide is comprised of terminal and internal AA repeat sequences. This peptide antigen is attached to the core peptide through covalent linkages to certain AA of the internal repeats. The 2 subunits of the heterodimer are arranged in a stable alpha-helical coiled-coil configuration having a 1:1 stoichiometry, and the peptide antigen is disposed toward the oute surfaces of the configuration. The heterodimer may be used as a synthetic vaccine (optionally multivalent) or to generate

R82592-R82600 and R83560-R83581 are peptide immunogens that are useful in vaccines for treating allergic reactions. In the immunogens, an IgE CH4 peptide is attached C-terminally to a series of amino acids including a helper T cell epitope. The immunogen may also opt. contain a fatty acid or fatty acid derivative, an invasin domain or alpha-NH2. The immunogen produces high titres of antibodies to the effector site in human IgE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IgE prodn. The immunogens may be used in either a radially branching multimeric form or a Sequence 27 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ladd AE, Wang CY, Zamb T;

Synthetic immunogenic peptides are provided in which a universal immune

Claims 8, 12; Page 84; 213pp; English.

Synthetic immunogenic peptides are provided or protein. The

stimulator is linked to a peptide or protein. The

and/or cytotoxic T lymphocyte epitopes, giving a product which causes

potent immune responses to the coupled peptide or protein. The

stimulator consists of (A) a promiscuous helper T cell epitope (Th)

which elicits an immune response to the coupled peptide in members of

a heterogeneous population expressing diverse HLA phenotypes, and (B)

an adjuvant peptide sequence from the invasin protein of Yersinia.

Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the immune stimulator and hapten

can be omitted from the immune stimulator components. When the immune stimulator components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the

This sequence is narticular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LUTRH-containing immunogenic peptide.

LHRH-containing immunogenic peptide.

Helper T cell epitope; universal immune stimulator; invasin; havaccine; LHRH; luteinising hormone releasing hormone; prostate; androgen-dependent carcinoma; antitumour; infertility; tetanus toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    epitope"

I mmunogenic luteinising hormone releasing hormone peptide(s) -

T that suppress LHRH activity in males and females

Disclosure; Page 95; 213pp; English.

Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic I lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th)

which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse ELA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia.

Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the invasin and Th domains and between the immune stimulator and hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immun

antibodies by in-vitro immunisation, which comprises: (a) separating peripheral mononuclear cells from blood using density gradient centrifugation; (b) treating the mononuclear cells with L-leucyl-L-leucine methyl ester; and (c) using the present antigen fragment, which is formed by coupled T and B cells, in a culture medium of human serum, IL-2 and T cells to effect cultivation and achieve in vitro immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                       hapten;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Indunogenic luteinising hormone releasing hormone peptide(s) -

That suppress LHRH activity in males and females

Disclosure; Page 95; 213pp; English.

Synthetic immunogenic peptides are provided in which a universal immune

Stimulator is linked to a peptide or protein hapten containing B cell

and/or cytotoxic T lymphocyte epitopes, giving a product which causes

cytimulator consists of (A) a promiscuous helper T cell epitope (Th)

which elicits an immune response to the coupled peptide in members of

a heterogeneous population expressing diverse HLA phenotypes, and (B)

an adjuvant peptide sequence from the invasin protein of Yersinia.

Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the

invasin and Th domains and between the immune stimulator and hapten

components. When the hapten is LHRH, then optionally the invasin domain

the present sequence is an example of a -GG-Th-GG-invasin immune

the present sequence is an example of a -GG-Th-GG-invasin immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 19

Immunogenic luteinising hormone releasing hormone peptide(s) -
That suppress LHRH activity in males and females
Claim 8; Page 88; 213pp; English.
Synthetic immunogenic peptides are provided in which a universal immune
stimulator is linked to a peptide or protein hapten containing B cell
and/or cytotoxic I lymphocyte epitopes, giving a product which causes
c stimulator consists of (A) a promiscuous helper T cell epitope (Th)
which elicits an immune response to the coupled peptide in members of
a heterogeneous population expressing diverse HLA phenotypes, and (B)
an adjuvant peptide sequence from the invasin protein of Yersinia.
Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the
invasin and Th domains and between the immune stimulator and hapten
components. When the hapten is LHRH, then optionally the invasin domain
can be omitted from the immune stimulator component.
The present sequence represents an LHRH-containing immunogenic peptide
as above which can be used as a potent vaccine for treating e.g.
                                                                                       immune
                                                                                                                                                                                                                                                                                             domain
                                                                                                                                                                                                                                                the
                                                                                                                                                                                                                                                                                                                                    peptide
                                                                                                                                                                                                                                                                                                                                                                                                  Ø
                                                                                                         cell
                                                                                                                                                                                        φţ
                                                                                                                                                                                                        (B)
                                                                                                                             causes
                                                                                                                                                                                                                                                                                                                      The present sequence represents an LHRH-containing immunogenic peptide as above which can be used as a potent vaccine for treating e.g. prostatic hyperplasia, androgen-dependent carcinoma, prostatic carcinoma, testicular carcinoma, endometriosis, benign uterine tumours recurrent functional ovarian cysts, (severe) premenstrual syndrome or oestrogen-dependent breast cancer, or for induction of infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           infertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

olecule_type protein
esidues
2-31 ##label DEF
The source of this protein was an extrachromosomal plasmid.
The source of this protein was an extrachromosomal plasmid.
The precursor is cleaved by endogenous proteinase activity to form light (fragment A) and heavy (fragment B.C) chains that are covalently linked by an interchain disulfide bond (the individual chains are not toxic when separated). The amino end of the heavy chain (fragment B) can be separated from the carboxyl end (fragment C) by papain.

Fragment C) by papain.
Fragment B forms ion channels in a lipid bilayer. Fragment C binds to gangliosides and may target the toxin to the motor end plate. Fragment A is a zinc-dependent endopeptidase.
This potent neurotoxin binds to peripheral neuronal synapses, is internalized, and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic cleavage of synaptobrevin (vesicle-associated membrane protein 2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dual

-!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC

ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77

BOND OF SYNAPTOBREVIN-2.

-!- CATALYTIC ACTIVITY: HYDROLYSIS OF 76-GLN-|-PHE-77 BOND IN

TNUCLEOCTIC SEQUENCE Of the gene coding for Clostridium botulinum

(Clostridium argentinense) type G neurotoxin: genealogical comparison

with other clostridial neurotoxins.";

BIOCHIM. BIOPHYS. ACTA 1216:487-491(1993).

-!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSIC

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND FRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC

ENDOPEPTIDASE.

-!- SUBUNIT: DISULFIDE-LINKED HETERODIMER OF A LIGHT CHAIN (L) AND A

ACTIVITY, WHILE THE N- AND C-TERMINAL OF THE HEAVY CHAIN MEDIATE

CHANNEL FORMATION SECRETED (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: SECRETED (BY SIMILARITY).

-!- THERE ARE SEVEN ANTIGENICALLY DISTINCT FORMS OF BOTULINUM

NEUROTOXIN: TYPES A, B, C1, D, E, F, AND G.

-!- THERE ARE SEVEN ANTIGENICALLY DISTINCT FORMS OF BOTULINUM

NEUROTOXIN: TYPES A, B, C1, D, E, F, AND G.

-!- SIMILARITY: BELONGS IF PREMEDATE THE MEDIATE THE
